Chapter 1

Introduction

1.1 Background

SPECFEM3D_GEOTECH is a free and open-source command-driven software for 3D slope stability analysis (For more detail see Gharti et al., 2011) and simulation of 3D multistage excavation (For more detail see Gharti et al., 2011) based on the spectral-element method (e.g., Patera, 1984; Canuto et al., 1988; Seriani, 1994; Faccioli et al., 1997; Komatitsch and Vilotte, 1998; Komatitsch and Tromp, 1999; Peter et al., 2011). The software can run on a single processor as well as multi-core machines or large clusters. It is written mainly in FORTRAN 90, and parallelized using MPI (Gropp et al., 1994; Pacheco, 1997) based on domain decomposition. For the domain decomposition, an open-source graph partitioning library SCOTCH (Pellegrini and Roman, 1996) is used. The element-by-element preconditioned conjugate-gradient method (e.g., Hughes et al., 1983; Law, 1986; King and Sonnad, 1987; Barragy and Carey, 1988) is implemented to solve the linear equations. For elastoplastic failure, Mohr-coulomb failure criterion is used with viscoplastic strain method (Zienkiewicz and Corneau, 1974).

This program does not automatically determine the factor of safety of the slope stability. Simulation can be performed for a series of safety factors. After plotting the safety factor vs maximum displacement curve, one can determine the factor of safety of the given slope. Although, the software is optimized for slope stability analysis and multistage excavation, other relevant simulations of static problems in solid (geo)mechanics can also be performed with this software.

The software currently does not include the inbuilt mesher. Existing tools such as Gmsh (Geuzaine and Remacle, 2009), CUBIT (CUBIT, 2011), TrueGrid (Rainsberger, 2006), etc. can be used for the hexahedral meshing, and the resulting mesh file can be converted to the input files required by the SPECFEM3D_GEOTECH. Output data can be visualized and processed using an open-source visualization application ParaView (www.paraview.org).

1.2 Status summary

Slope stability analysis : Yes

Multistage excavation : Yes

Gravity loading	: Yes
Surface loading	: Yes (point load, uniformly distributed load, linearly distributed load) [Experimental]
Water table	: Yes [Experimental]
Pseudo-static earthquake loading	: Yes [Experimental]
Automatic factor of safety	: No

Chapter 2

Getting started

2.1 Package structure

Original SPECSEM3D_GEOTECH package comes in a single compressed file SPECSEM3D_GEOTECH.tar.gz, which can be extracted using `tar` command:

```
tar -zxvf SPECSEM3D_GEOTECH.tar.gz
```

Or

using, for example, 7-zip (www.7-zip.org) in WINDOWS. The package has a following structure.

SPECSEM3D_GEOTECH/

COPYING	: License.
README	: brief description of the package.
CMakeLists.txt	: CMake configuration file.
bin/	: all object files and executables are stored in this folder.
doc/	: documentation files for the SPECSEM3D_GEOTECH package. If built this file is created.
input/	: contains input files.
partition/	: contains partition files for parallel processing.
output/	: default output folder. All output files are stored in this folder unless the different output path is defined in the main input file.
src/	: contains all source files.

2.2 Prerequisites

- CMake build system. The CMake version $\geq 2.8.4$ is necessary to configure the software. It is free and open-source, and can be downloaded from www.cmake.org.

- Make utility. The make utility is necessary to build the software using Makefile. This utility is usually installed by default in most of the LINUX systems. In WINDOWS, one can use Cygwin (www.cygwin.com) or MinGW (www.mingw.org) to install the make utility.
- A recent FORTRAN compiler. The software is written mainly in FORTRAN 90, but it also uses a few FORTRAN 2003 features (e.g., streaming IO). These features are already available in most of the FORTRAN compilers, e.g., gfortran version ≥ 4.2 (gcc.gnu.org/wiki/GFortran) and g95 (www.g95.org).

Following libraries are necessary for parallel processing.

- A recent MPI library. It should be built with same FORTRAN compiler which will be used to compile the software. Please see www.open-mpi.org or www.mcs.anl.gov/research/projects/mpich2 for detail on how to install MPI library and how to run MPI programs.
- SCOTCH graph partitioning library. This library should be compiled with same FORTRAN compiler which will be used to compile the software. Please see www.labri.fr/perso/pelegrin/scotch for detail on how to install SCOTCH. Version 5.1.7 was successfully tested with SPECFEM3D_GEOTECH.

Finally, following compiler is necessary to build the documentation (this file).

- L^AT_EX compiler. This is necessary to compile the documentation files.

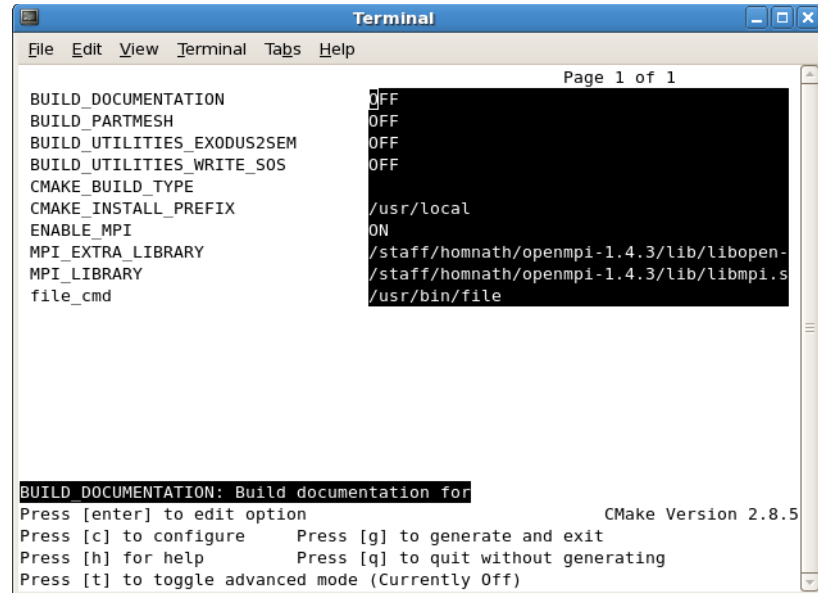

2.3 Configure

Software package SPECFEM3D_GEOTECH is configured using CMake, and the package uses out-of-source build. Hence, DO NOT build in the same source directory. Let's say the full path to the package (source directory) is `$HOME/download/SPECFEM3D_GEOTECH`.

- Create a separate build directory, e.g.,
`mkdir $HOME/work/SPECFEM3D_GEOTECH`
- Go to build directory
`cd $HOME/work/SPECFEM3D_GEOTECH`
- Type cmake command
`ccmake $HOME/projects/SPECFEM3D_GEOTECH`

CMake configuration is an iterative process (See Figure 2.1):

- Configure (c key or Configure button)
- Change variables' values if necessary
- Configure (c key or Configure button)

The image shows a terminal window titled "Terminal" with a menu bar (File, Edit, View, Terminal, Tabs, Help). The window displays the CMake configuration interface for a project named "SPECSEM3D_GEOTECH". The configuration variables are listed on the left, and their values are shown on the right. The variables and their values are:

Variable	Value
BUILD_DOCUMENTATION	OFF
BUILD_PARTMESH	OFF
BUILD_UTILITIES_EXODUS2SEM	OFF
BUILD_UTILITIES_WRITE_SOS	OFF
CMAKE_BUILD_TYPE	
CMAKE_INSTALL_PREFIX	/usr/local
ENABLE_MPI	ON
MPI_EXTRA_LIBRARY	/staff/homnath/openmpi-1.4.3/lib/libopen-
MPI_LIBRARY	/staff/homnath/openmpi-1.4.3/lib/libmpi.s
file_cmd	/usr/bin/file

At the bottom of the terminal, there is a prompt "BUILD DOCUMENTATION: Build documentation for" and a list of instructions for navigating the CMake interface:

```
Press [enter] to edit option
Press [c] to configure      Press [g] to generate and exit
Press [h] for help          Press [q] to quit without generating
Press [t] to toggle advanced mode (Currently Off)
```

The CMake version is 2.8.5.

Figure 2.1: CMake configuration of SPECSEM3D_GEOTECH .

If WARNINGS or ERRORS occur, press e key (or OK button) to return to configuration. These steps have to be repeated until successful configuration. Then, press g key (or Generate button) to generate build files. Check carefully that all necessary variables are set properly. Unless configuration is successful, generate is not enabled. Sometimes, c key (or Configure button) has to be pressed repeatedly until generate is enabled. Initially, all variables may not be visible. To see all variables, toggle advanced mode pressing t key (or Advanced button). To set or change a variable, move the cursor to the variable and press Enter key. If the variable is a boolean (ON/OFF), it will flip the value on pressing the Enter key. If the variable is a string or a file, it can be edited. For more detail, please see the CMake documentation (www.cmake.org).

Following are the main CMake variables for the SPECSEM3D_GEOTECH (See Figure 2.1)

<code>BUILD_DOCUMENTATION</code>	: If <code>ON</code> , user manual (this file) is created. The default is <code>OFF</code> .
<code>BUILD_PARTMESH</code>	: If <code>ON</code> , <code>partmesh</code> program is built. The default is <code>OFF</code> . The <code>partmesh</code> program is necessary to partition the mesh for parallel processing.
<code>BUILD_UTILITIES_EXODUS2SEM</code>	: If <code>ON</code> , <code>exodus2sem</code> program is built. The default is <code>OFF</code> . The <code>exodus2sem</code> program convert exodus mesh file to input files required by the <code>SPECFEM3D_GEOTECH</code> package (see also Chapter 5).
<code>BUILD_UTILITIES_WRITE_SOS</code>	: If <code>ON</code> , <code>write_sos</code> program is built. The default is <code>OFF</code> . The <code>write_sos</code> program writes a EnSight SOS file necessary for the parallel visualization (see also Chapter 5).
<code>ENABLE_MPI</code>	: If <code>ON</code> , main parallel program <code>psemgeotech</code> is built otherwise main serial program <code>semgeotech</code> is built. The default is <code>OFF</code> .
<code>SCOTCH_LIBRARY_PATH</code>	: This is required if <code>BUILD_PARTMESH</code> is <code>ON</code> . If not found automatically, it can be set manually.
<code>CMAKE_Fortran_COMPILER</code>	: This defines the Fortran compiler. If not found automatically or automatically found compiler is not correct, it can be set manually.

Note 1: If `CMAKE_Fortran_COMPILER` has to be changed, first change this and configure, and then change other variables if necessary and configure.

Note 2: Even if some of the above variables are set `ON`, if appropriate working compilers are not found, corresponding variables are internally set `OFF` with `WARNING` message.

2.4 Compile

Once configuration and generation are successful, necessary build files are created. Now to build the main program, type:

```
make
```

On the multi-processor system (let's say eight processor), type:

```
make -j 8
```

To clean, type

```
make clean
```

Note: If reconfiguration is necessary, it is better to delete all Cache files of the build directory.

2.5 Run

Serial run

- To run serial program, type
`./bin/semgeotech input_file_name`

Example:

```
./bin/semgeotech ./input/validation1.sem
```

Parallel run

- To partition the mesh, type
`./bin/partmesh input_file_name`

Example:

```
./bin/partmesh ./input/validation1.psem
```

- To run parallel program, type
`mpirun -n number_of_nodes ./bin/psemgeotech input_file_name`

OR

```
mpirun -n number_of_nodes --hostfile host_file ./bin/psemgeotech input_file_name
```

Example:

```
mpirun -n 8 ./bin/psemgeotech ./input/validation1.psem
```

Note: see Chapter 3 for detail on input and input files. Try to run one or more examples included in `input/`. By default, example files included in the package are not copied to build directory during build process. If necessary, copy files within `input/` folder of source directory to the `input/` folder of build directory.

Chapter 3

Input

3.1 Main input file

Main input file structure is motivated by the “E3D” (Larsen and Schultz, 1995) software package. The main input file consists of legitimate input lines defined in the specified formats. Any number of blank lines or comment lines can be placed for user friendly input structure. The blank lines contain no or only white-space characters, and the comment lines contain "#" as the first character.

Each legitimate input line consists of a line type, and list of arguments and corresponding values. All argument-value pair are separated by comma (.). If necessary, any legitimate input line can be continued to next line using FORTRAN 90 continuation character "&" as an absolute last character of a line to be continued. Repetition of same line type is not allowed.

Legitimate input lines have the format

line_type *arg*₁ = *val*₁, *arg*₂ = *val*₂,, *arg*_{*n*} = *val*_{*n*}

Example:

```
preinfo:  nproc=8, ngllx=3, nglly=3, ngllz=3, nenod=8, ngnod=8, &  
inp_path='../input', part_path='../partition', out_path='../output/'
```

All legitimate input lines should be written in lower case. Line type and argument-value pairs must be separated by space. Each argument-value pair must be separated by comma(,) and space/s. No space/s are recommended before line type and in between argument name and "=" or "=" and argument value. If argument value is a string, the FORTRAN 90 string (i.e., enclosed within the single quotes) should be used, for example, `inp_path='../input'`. If the argument value is a vector (i.e., multi-valued), a list of values separated by space (no comma!) should be used, e.g, `srf=1.0 1.2 1.3 1.4`.

3.1.1 Line types

Only the following line types are permitted.

`preinfo:` preliminary information of the simulation

`mesh:` mesh information

bc: boundary conditions information
traction: traction information [optional]
stress0: initial stress information [optional]. It is generally necessary for multistage excavation.
material: material properties
eqload: pseudo-static earthquake loading [optional]
water: water table information [optional]
control: control of the simulation
save: options to save data

3.1.2 Arguments

Only the following arguments under the specified line types are permitted.

preinfo:

nproc : number of processors to be used for the parallel processing [integer > 1]. Only required for parallel processing.
ngllx : number of Gauss-Lobatto-Legendre (GLL) points along x -axis [integer > 1].
nglly : number of GLL points along y -axis [integer > 1].
ngllz : number of GLL points along z -axis [integer > 1].

*Note: Although the program can use different values of **ngllx**, **nglly**, and **ngllz**, it is recommended to use same number of GLL points along all axes.*

inp_path : input path where the input data are located [string, optional, default \Rightarrow '../input'].
part_path : partition path where the partitioned data will be or are located [string, optional, default \Rightarrow '../partition']. Only required for parallel processing.
out_path : output path where the output data will be stored [string, optional, default \Rightarrow '../output'].

mesh:

xfile : file name of x -coordinates [string].
yfile : file name of y -coordinates [string].
zfile : file name of z -coordinates [string].

confile : file name of mesh connectivity [string].

idfile : file name of element IDs [string].

gfile : file name of ghost interfaces, i.e., partition interfaces [string]. Only required for parallel processing.

bc:

uxfile : file name of displacement boundary conditions along x -axis [string].

uyfile : file name of displacement boundary conditions along y -axis [string].

uzfile : file name of displacement boundary conditions along z -axis [string].

traction:

trfile : file name of traction specification [string].

stress0:

type : type of initial stress [integer, optional, 0 = compute using SEM itself, 1 = compute using simple vertical lithostatic relation, default \Rightarrow 0].

z0 : datum (free surface) coordinate [real, m]. Only required if **type**=1.

s0 : datum (free surface) vertical stress [real, kN/m²]. Only required if **type**=1.

k0 : lateral earth pressure coefficient [real].

material:

matfile : file name of material list [string].

ispart : flag to indicate whether the material file is partitioned [integer, optional, 0 = No, 1 = Yes, default \Rightarrow 1]. Only required for parallel processing.

matpath : path to material file [string, optional, default \Rightarrow '../input' for serial or unpartitioned material file in parallel and '../partition' for partitioned material file in parallel].

allelastic : assume all entire domain as elastic [integer, optional, 0 = No, 1 = Yes, default \Rightarrow 0].

eqload:

eqkx : pseudo-static earthquake loading coefficient along x -axis [real, $0 \leq \text{eqkx} \leq 1.0$, default \Rightarrow 0.0].

eqky : pseudo-static earthquake loading coefficient along y -axis [real, $0 \leq \text{eqky} \leq 1.0$, default \Rightarrow 0.0].

eqkz : pseudo-static earthquake loading coefficient along z -axis [real, $0 \leq \text{eqkz} \leq 1.0$, default $\Rightarrow 0.0$].

*Note: For the stability analysis purpose, these coefficients should be chosen carefully. For example, if the slope face is pointing towards the negative x -axis, value of **eqkx** is taken negative.*

water:

wsfile : file name of water surface file.

control:

cg_tol : tolerance for conjugate gradient method [real].

cg_maxiter : maximum iterations for conjugate gradient method [integer > 0].

nl_tol : tolerance for nonlinear iterations [real].

nl_maxiter : maximum iterations for nonlinear iterations [integer > 0].

ninc : number of load increments for the plastic iterations [integer > 0 default $\Rightarrow 1$]. This is currently not used for slope stability analysis.

Arguments specific to slope stability analysis:

nsrf : number of strength reduction factors to try [integer > 0 , optional, default $\Rightarrow 1$].

srf : values of strength reduction factors [real vector, optional, default $\Rightarrow 1.0$]. Number of **srfs** must be equal to **nsrf**.

phinu : force $\phi - \nu$ (Friction angle - Poisson's ratio) inequality: $\sin \phi \geq 1 - 2\nu$ (see Zheng et al., 2005) [integer, 0 = No, 1 = Yes, default $\Rightarrow 0$]. Only for TESTING purpose.

Arguments specific to multistage excavation:

nexcav : number of excavation stages [integer > 0 , optional, default $\Rightarrow 1$].

nexcavid : number of excavation IDs in each excavation stage [integer vector, default $\Rightarrow 1$].

excavid : IDs of blocks/regions in the mesh to be excavated in each stage [integer vector, default $\Rightarrow 1$].

Note: Do not mix arguments for slope stability and excavation.

save:

disp : displacement field [integer, optional, 0 = No, 1 = Yes, default $\Rightarrow 0$].

porep : pore water pressure [integer, optional, 0 = No, 1 = Yes, default $\Rightarrow 0$].

3.1.3 Examples of main input file

Input file for a simple elastic simulation

```
#-----  
#input file elastic.sem  
#pre information  
preinfo:  ngllx=3, nglly=3, ngllz=3, nenod=8, ngnod=8, &  
inp_path='../input', out_path='../output/'  
  
#mesh information  
mesh:  xfile='validation1_coord_x', yfile='validation1_coord_y', &

#boundary conditions
bc: uxfile='excavation_3d_ssbucx', uyfile='excavation_3d_ssbucy', &
uzfile='excavation_3d_ssbucz'

#initial stress stress0: type=0, z0=0, s0=0, k0=0.5, usek0=1

#material list
material: matfile='excavation_3d_material_list'

#control parameters
control: cg_tol=1e-8, cg_maxiter=5000, nl_tol=0.0005, nl_maxiter=3000, &
nexcav=3, excavid=2 3 4, ninc=10
#-----
```

There are only two additional informations, i.e., number of processors 'nproc' in line 'preinfo' and file name for ghost partition interfaces 'gfile' in line 'mesh' in parallel input file.

3.2 Input files detail

All local element/face/edge/node numbering follows the EXODUS II convention.

3.2.1 Coordinates files: xfile, yfile, zfile

Each of the coordinates files contains list of corresponding coordinates in following format:

```
number of points
coordinate of point 1
coordinate of point 2
coordinate of point 3
..
..
..
```

Example:

```
2354
40.230394465164999
40.759090909090901
42.700000000000003
40.957142857142898
40.230394465164999
40.759090909090901
42.700000000000003
40.957142857142898
...
...
```

3.2.2 Connectivity file: confile

The connectivity file contains the connectivity lists of elements in following format:

```
number of elements
n1 n2 n3 n4 n5 n6 n7 n8 of element 1
n1 n2 n3 n4 n5 n6 n7 n8 of element 2
n1 n2 n3 n4 n5 n6 n7 n8 of element 3
n1 n2 n3 n4 n5 n6 n7 n8 of element 4
..
..
```

Example:

```
1800
1 2 3 4 5 6 7 8
9 10 2 1 11 12 6 5
9 1 4 13 11 5 8 14
15 16 10 9 17 18 12 11
15 9 13 19 17 11 14 20
21 22 16 15 23 24 18 17

3.2.3 Element IDs (or Material IDs) file: idfile

This file contains the IDs of elements. This ID will be used in the program mainly to identify the material regions. This file has a following format:

```
number of elements
ID of element 1
ID of element 2
ID of element 3
ID of element 4
...
...
```

Example:

```
1800
1
1
1
1
1
1
1
1
1
1
1
...
...
```

3.2.4 Ghost partition interfaces file: gfile

This file will be generated automatically by a program `partmesh`.

3.2.5 Displacement boundary conditions files: uxfile, uyfile, uzfile

This file contains information on the displacement boundary conditions (currently only the zero-displacement is implemented), and has following format:

```
number of element faces
elementID faceID
elementID faceID
elementID faceID
...
...
```

Example:

```
849
2 2
3 4
5 1
6 1
7 1
8 1
9 1
...
...
```

3.2.6 Traction file: trfile

This file contains the traction information on the model in the following format:

```
traction type (integer, 0 = point, 1 = uniformly distributed, 2 = linearly distributed)
if traction type = 0
qx qy qz (load vector in kN)
if traction type = 1
qx qy qz (load vector in kN/m2)
if traction type = 2
relevant-axis x1 x2 qx1 qy1 qz1 qx2 qy2 qz2
number of entities (points for point load or faces for distributed load)
elementID entityID
elementID entityID
elementID entityID
...
...
```

This can be repeated as many times as many tractions.

The *relevant-axis* denotes the axis along which the load is varying, and it is represented by an integer as 1 = *x*-axis, 2 = *y*-axis, and 3 = *z*-axis. The variables *x₁* and *x₂* denote the coordinates (only the *relevant-axis*) of two points between which the linearly distributed load is applied. Similarly, *q_{x1}*, *q_{y1}* and *q_{z1}*, and *q_{x2}*, *q_{y2}* and *q_{z2}* denote the load vectors in kN/m² at the point 1 and 2, respectively.

Example:

Following data specify the two tractions: a uniformly distributed traction and a linearly distributed traction.

```

3.2.7 Material list file: matfile

This file contains material properties of each material regions. Material properties must be listed in a sequential order of the unique material IDs. In addition, this data file optionally contains the information on the water condition of material regions. Material regions or material IDs must be consistent with the Material IDs (Element IDs) defined in `idfile`. The `matfile` has following format:

```

comment line
number of material regions (unique material IDs)
materialID, domainID,  $\gamma$ ,  $E$ ,  $\nu$ ,  $\phi$ ,  $c$ ,  $\psi$ 
materialID, domainID,  $\gamma$ ,  $E$ ,  $\nu$ ,  $\phi$ ,  $c$ ,  $\psi$ 
materialID, domainID,  $\gamma$ ,  $E$ ,  $\nu$ ,  $\phi$ ,  $c$ ,  $\psi$ 
...
...
number of submerged material regions
submerged materialID
submerged materialID
...
...

```

The *materialID* must be in a sequential order starting from 1. The *domainID* represents

the material domain (e.g., isotropic or anisotropic), and it is currently irrelevant, therefore, always use 1. Similarly, γ represents the unit weight in kN/m^3 , E the Young's modulus of elasticity in kN/m^2 , ϕ the angle of internal friction in degrees, c the cohesion in kN/m^2 , and ψ the angle of dilation in degrees.

Example:

Following data defines four material regions. No region is submerged in water.

```
# material properties (id, domain, gamma, ym, nu, phi, coh, psi)
4
1 1 18.8 1e5 0.3 20.0 29.0 0.0
2 1 19.0 1e5 0.3 20.0 27.0 0.0
3 1 18.1 1e5 0.3 20.0 20.0 0.0
4 1 18.5 1e5 0.3 20.0 29.0 0.0
```

Following data defines four material regions with two of them submerged.

```
# material properties (id, domain, gamma, ym, nu, phi, coh, psi)
4
1 1 18.8 1e5 0.3 20.0 0.0 0.0
2 1 19.0 1e5 0.3 20.0 27.0 0.0
3 1 18.1 1e5 0.3 20.0 0.0 0.0
4 1 18.5 1e5 0.3 20.0 29.0 0.0
2
1
3
```

3.2.8 Water surface file: wsfile

This file contains the water table information on the model in the format as

number of water surfaces

water surface type (integer, 0 = horizontal surface, 1 = inclined surface, 2 = meshed surface)

if *wstype*=0 (can be reconstructed by sweeping a horizontal line)

relevant-axis x_1 x_2 z

if *wstype*=1 (can be reconstructed by sweeping a inclined line)

relevant-axis x_1 x_2 z_1 z_2

if *wstype*=2 (meshed surface attached to the model)

number of faces

elemetID, *faceID*

elemetID, *faceID*

elemetID, *faceID*

...

...

The *relevant-axis* denotes the axis along which the line is defined, and it is taken as 1 = x -axis, 2 = y -axis, and 3 = z -axis. The variables x_1 and x_2 denote the coordinates (only *relevant-axis*) of point 1 and 2 that define the line. Similarly, z denotes a z -coordinate of a horizontal water surface, and z_1 and z_2 denote the z -coordinates of the two points (that define the line) on the water surface.

Example:

Following data specify the two water surfaces: a horizontal surface and an inclined surface.

```
2
0
1 42.7 50.0 6.1
1
1 0.0 42.7 12.2 6.1
```

Chapter 4

Output and Visualization

4.1 Output files

4.1.1 Summary file

This file is self explanatory and it contains the summary of the result including control parameters, maximum displacement at each step, and elapsed time. The file is written in ASCII format and its name follows the convention *input_file_name_header_summary* for serial run and *input_file_name_header_summary_procprocessor_ID* for parallel run.

4.1.2 Mesh files

This file contains the mesh information of the model including coordinates, connectivity, element types etc. in EnSight Gold binary format (see EnSight, 2008). The file name follows the format *input_file_name_header_summary* for serial run and *input_file_name_header_summary_procprocessor_ID* for parallel run.

4.1.3 Displacement field file

This file contains the nodal displacement field in the model written in EnSight Gold binary format. The file name follows the format *input_file_name_header_stepstep.dis* for serial run and *input_file_name_header_stepstep_procprocessor_ID.dis* for parallel run.

4.1.4 Pore pressure file

This file contains the hydrostatic pore pressure field in the model written in EnSight Gold binary format. The file name follows the format *input_file_name_header_stepstep.por* for serial run and *input_file_name_header_stepstep_procprocessor_ID.por* for parallel run.

4.1.5 CASE file

This is an EnSight Gold CASE file written in ASCII format. This file contain the information on the mesh files, other files, time steps etc. The file name follows the format *input_file_name_header.case* for serial run and *input_file_name_header_procprocessor_ID.case* for parallel run.

4.1.6 SOS file

This is an EnSight Gold server-of-server file for parallel visualization. The `write_sos.f90` program provided in the `/utilities/` may be used to generate this file. See Chapter 5, Section 5.2 for more detail.

All above EnSight Gold files correspond to the model with spectral-element mesh. Additionally, the CASE file/s and mesh file/s are written for the original model. These file names follow the similar conventions and they have the tag '`original`' in the file name headers.

4.2 Visualization

4.2.1 Serial visualization

Requirement: ParaView version later than 3.7. Precompiled binaries available from ParaView web (www.paraview.org) may be installed directly or it can be build from the source.

- open a session
- open paraview client
`paraview`
- In ParaView client: \Rightarrow File \Rightarrow Open
select appropriate serial CASE file (.case file)
see ParaView wiki paraview.org/Wiki/ParaView for more detail.

4.2.2 Parallel visualization

Requirement: ParaView version later than 3.7. It should be built enabling MPI. An appropriate MPI library is necessary.

- open a session
- open paraview client
`paraview`
- start ParaView server
`mpirun -np 8 pvserver -display :0`
- In ParaView client: \Rightarrow File \Rightarrow Connect and connect to the appropriate server
- In ParaView client: \Rightarrow Open
select appropriate SOS file (.sos file)
see ParaView wiki (paraview.org/Wiki/ParaView) for more detail.

Note: Each CASE file obtained from the parallel processing can also be visualized in a serial.

Chapter 5

Utilities

5.1 Convert EXODUS mesh into SEM files

The program `exodus2sem.c` contained in the utilities directory can be used to convert the mesh file in EXODUS II format to input files required by the SPECSEM3D_GEOTECH .

Compile

```
gcc -o exodus2sem exodus2sem.c
```

Run

```
exodus2sem EXODUS_mesh_file OPTIONS
```

For more detail, see `/utilities/README_exodus2sem`. It can also be compiled automatically during the build process of main package SPECSEM3D_GEOTECH (see Section 2.3).

5.2 Generate SOS file

The program `write_sos.f90` contained in the utilities directory can be used to write EnSight Gold server-of-server file (.sos file, see (EnSight, 2008)) to visualize the multi-processors data in parallel. This file does not contain the actual data, but only the information on the data location and parallel processing.

Compile

```
gfortran -o write_sos write_sos.f90
```

Run

```
exodus2sem input_file
```

For more detail, see `/utilities/README_write_sos`. It can also be compiled automatically during the build process of main package SPECSEM3D_GEOTECH (see Section 2.3).
